

Student Contribution Report

Project: NBP Analyzer

Team: BunniHopPon

Student: Andrii Bialkovskyi 253190

Role: Scrum Master / DevOps

Overview

As the Scrum Master and DevOps engineer for team BunniHopPon, my primary responsibilities centered around Agile project management, facilitating team workflows, establishing the CI/CD infrastructure, and coordinating code integration.

Key contributions

1. Scrum Master & Agile Management

- Acted as the Scrum Master, ensuring the team adhered to Agile principles and the Scrum framework throughout the project lifecycle.
- Organized and facilitated regular periodic Scrum events, including Sprint Planning, Sprint Reviews, and Sprint Retrospectives.
- Managed and maintained the Product Backlog and Sprint Backlog using Trello, ensuring tasks were properly defined, prioritized, estimated, and assigned.
- Monitored project progress and team velocity, actively addressing blockers and facilitating communication to keep the team aligned with project goals.
- Coordinated the initial project planning phases and ensured continuous collaboration between team members.

2. CI/CD Pipeline Implementation

- Designed and configured the Continuous Integration (CI) pipeline using GitHub Actions to automatically execute linting and testing jobs for pull requests targeting the main, release, and develop branches.
- Implemented the Continuous Deployment (CD) pipeline to automatically deploy the frontend application to GitHub Pages upon successful merges.
- Configured automated semantic release tagging (starting from v2.0.0) triggered by successful pull requests to the release branch.

3. Code Integration & Release Management

- Managed the Git repository structure, including the initial setup, branching strategy, and the required repository cleanup (clearing release and develop branches).
 - Approved pull requests submitted by the tester and managed final merges.
4. Technical Contributions & Initial Setup
- Bootstrapped the initial frontend project structure, which unblocked the team for parallel test-driven development.
 - Contributed to the project's README.md to document the project's techstack, CI/CD configuration, deployment details, and provide links to our Trello board and Figma designs.

Conclusions

Through my role as Scrum Master and DevOps, I ensured the team maintained a robust, automated development workflow and adhered to Agile methodologies. My efforts in organizing the team, managing the Trello backlog, and automating the CI/CD pipeline directly contributed to fulfilling the assignment's technical and project management requirements.
